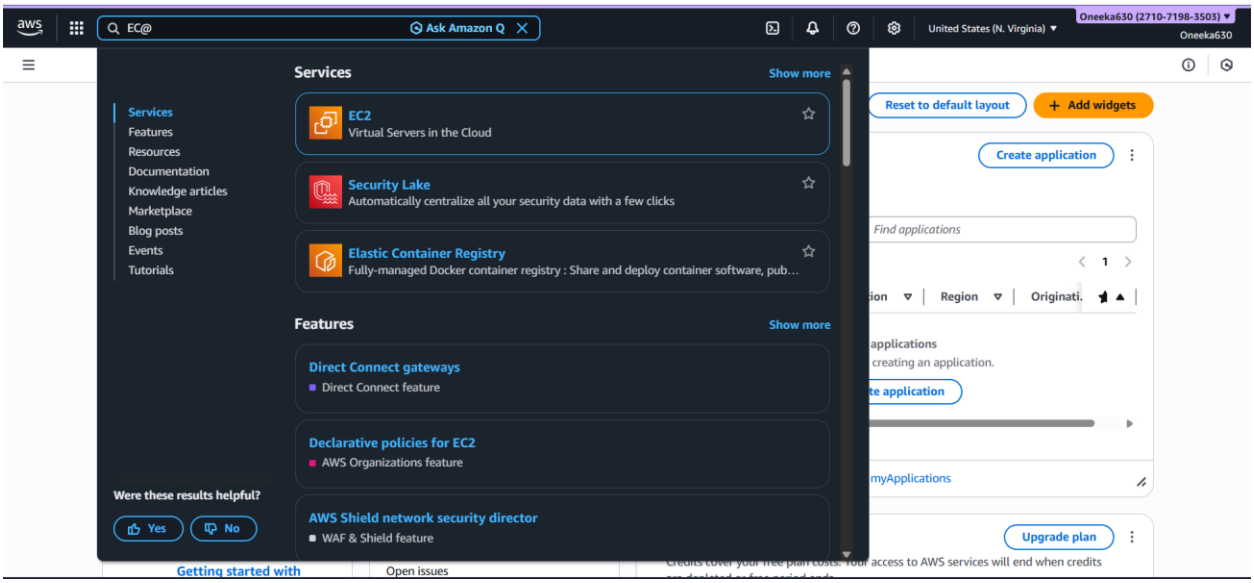
NAME: ONEEKA KUNDU ROLL: 129 EXAM ROLL: 11600223145

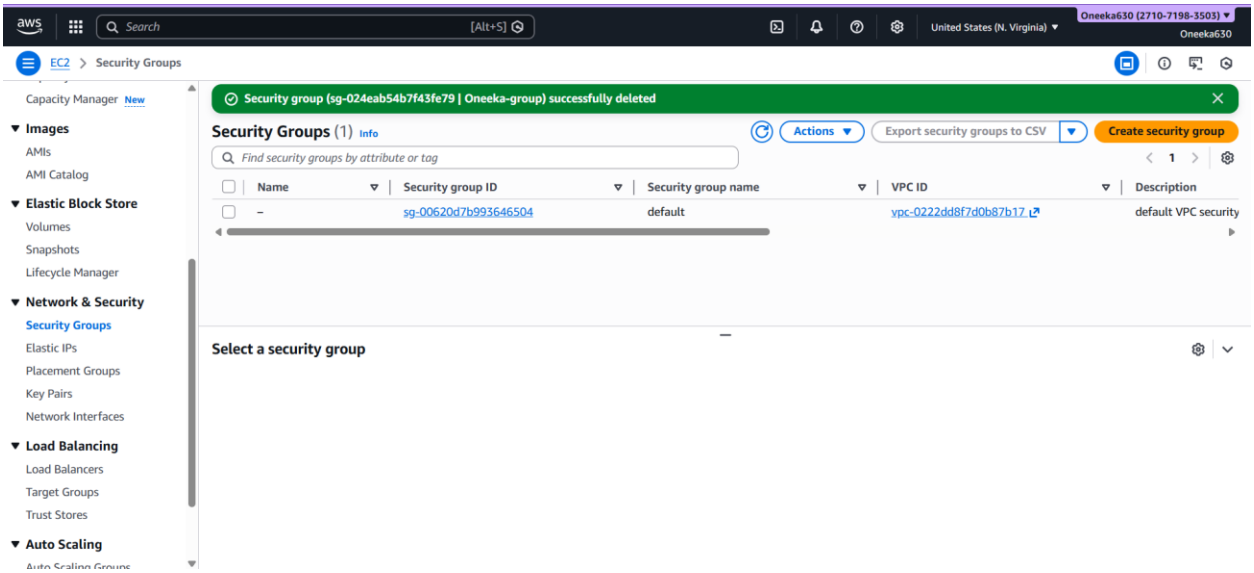
Assignment No. 10

Problem Definition: - **Deploy a project from GitHub to EC2 by creating a new security group and user data.**

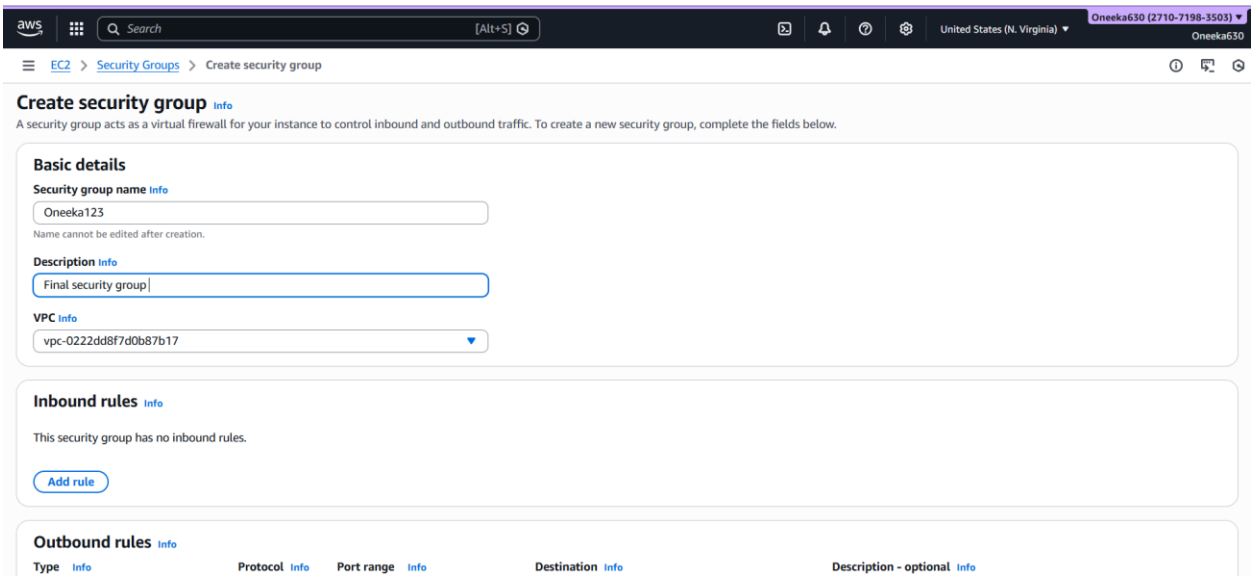
STEP 1. Sign up for an AWS account, search for '**EC2**' then click on it.



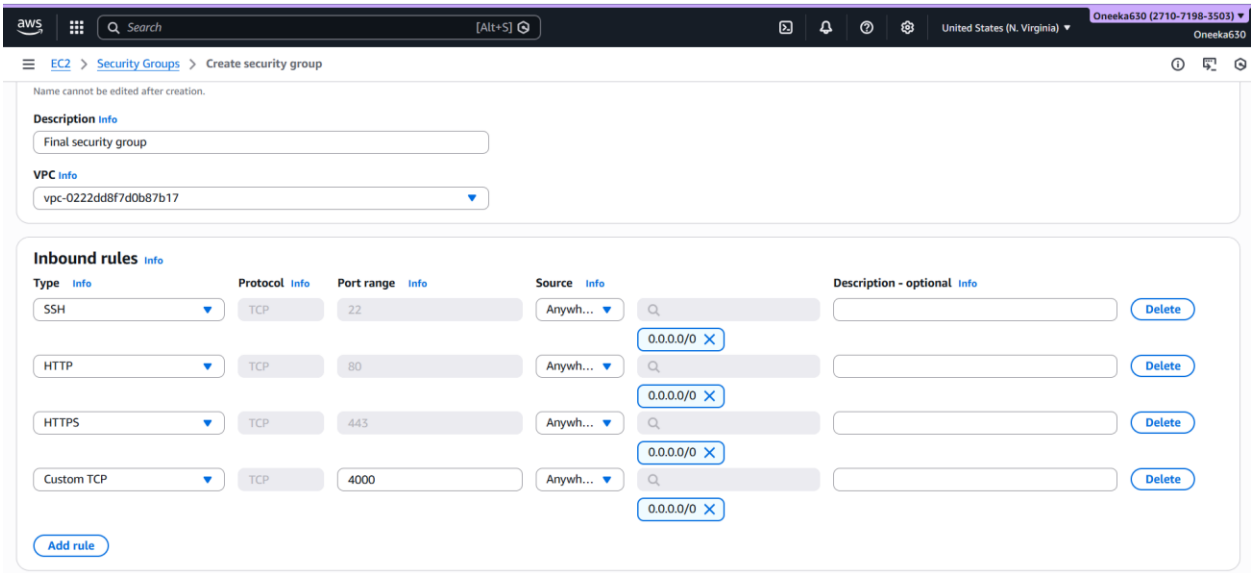
STEP 2. Click on '**Security Groups**'.



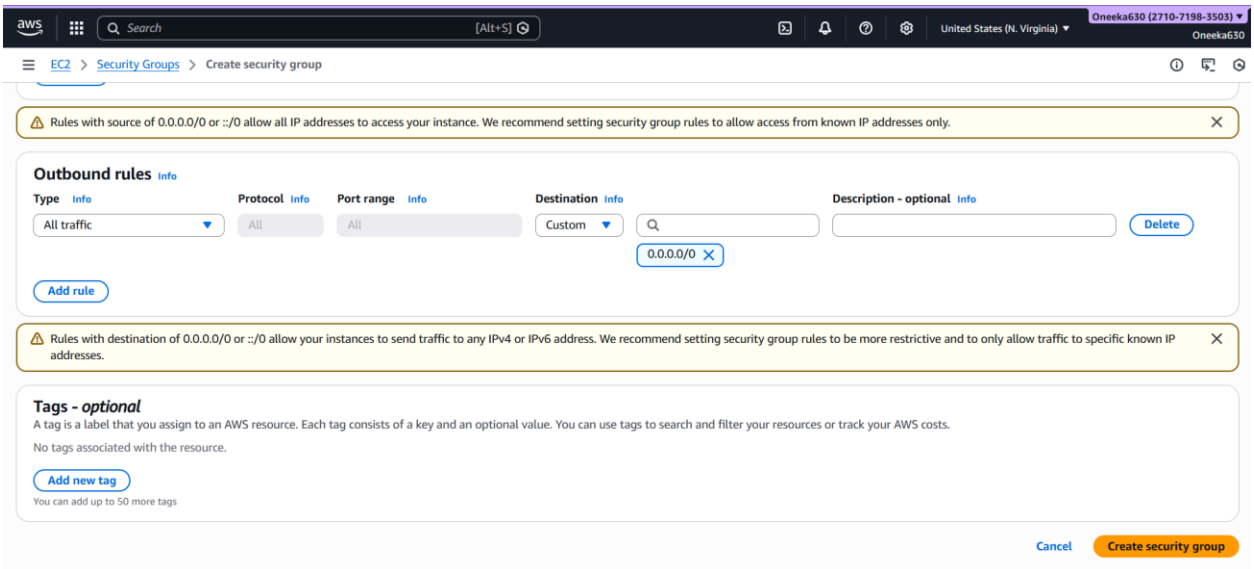
STEP 3. Go to '**Create security group**'. -> Add basic details. -> In '**Inbound rules**' go to '**Add rule**'.



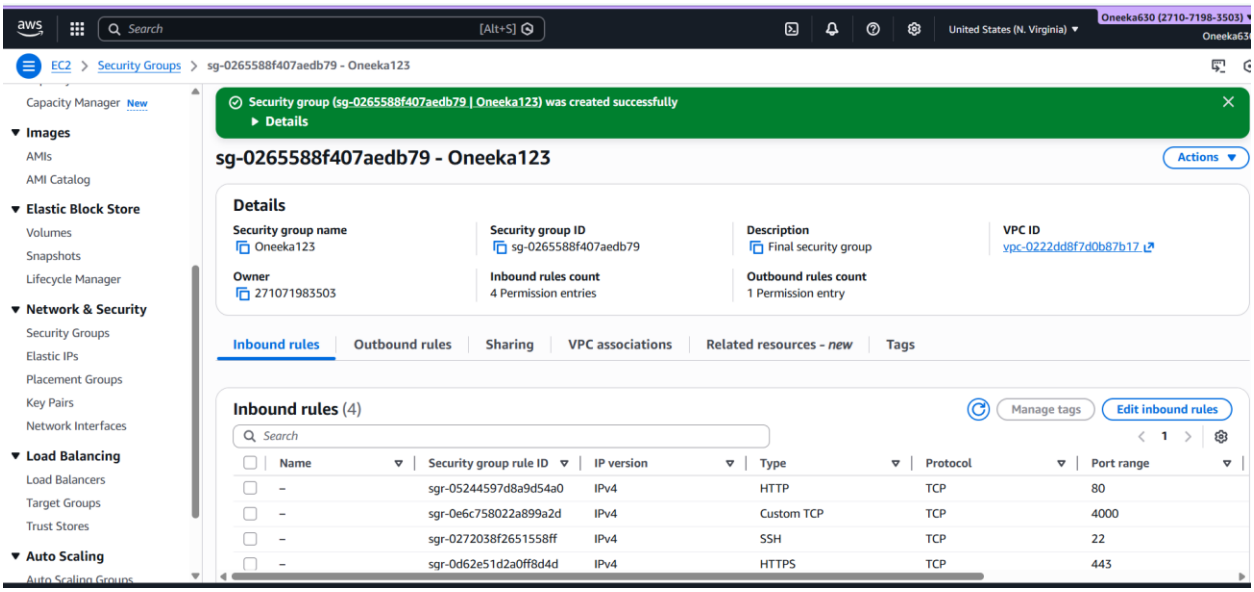
STEP 4. Add all the necessary rules like **SSH**, **HTTP** and **HTTPS** from anywhere; along with a **Custom TCP** rule allowing traffic on **port 4000** from anywhere.



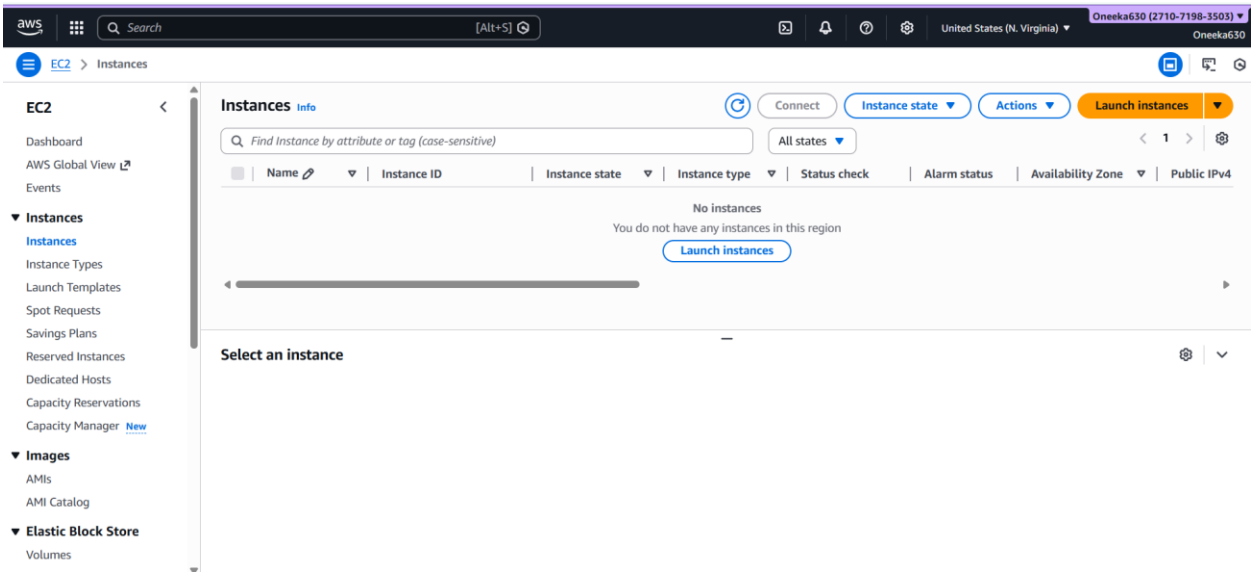
STEP 5. Then finally '**Create security group**'.



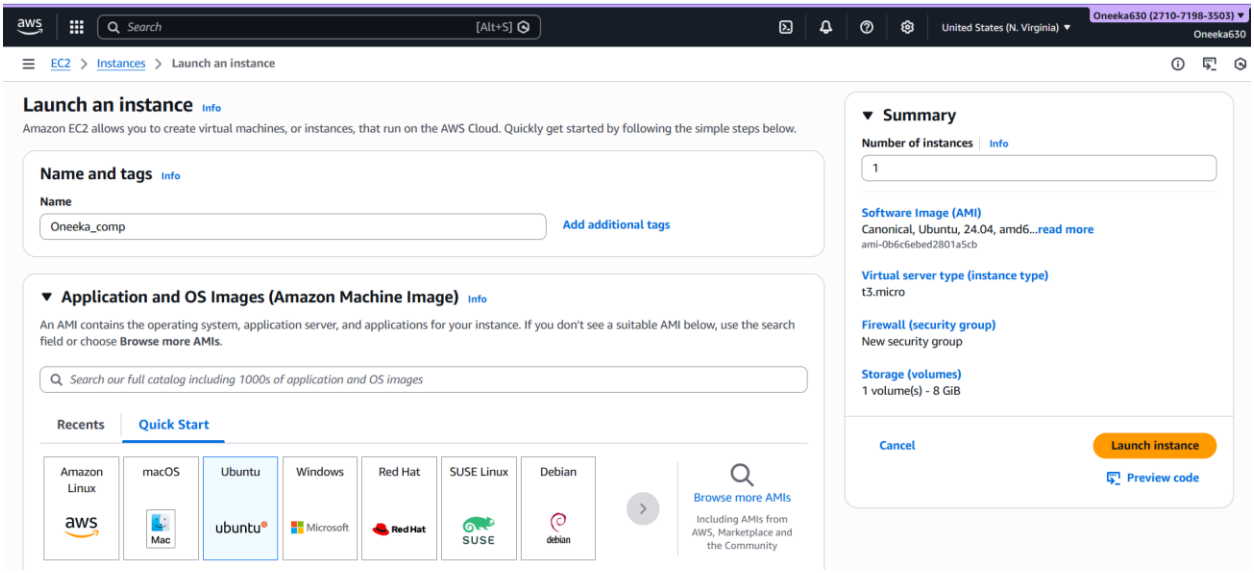
STEP 6. After the security group is created, go to '**EC2 Dashboard**'.



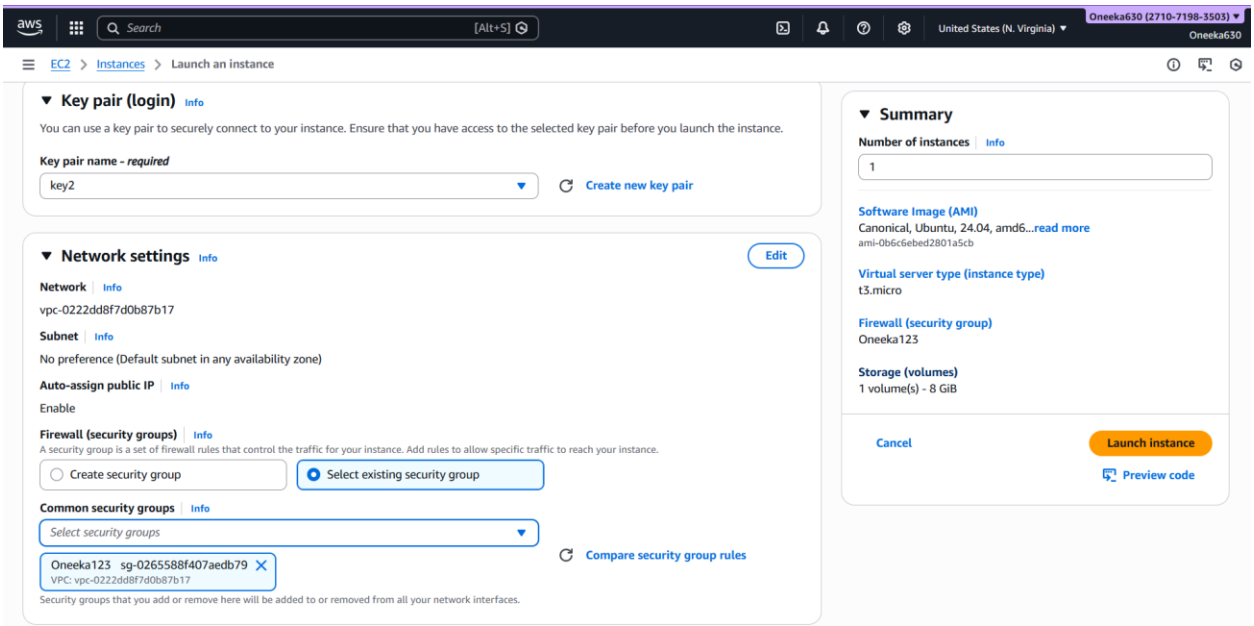
STEP 7. Click on '**Launch instance**'.



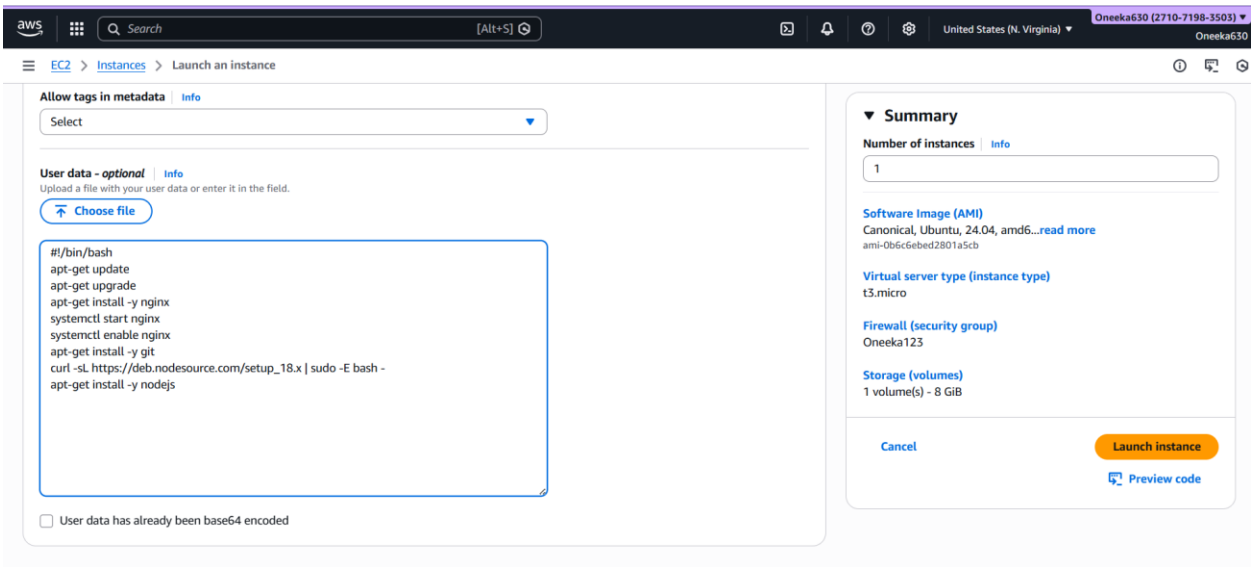
STEP 8. Fill up the required details-> '**Name**' and under '**Application and OS Images**' select '**ubuntu**'.



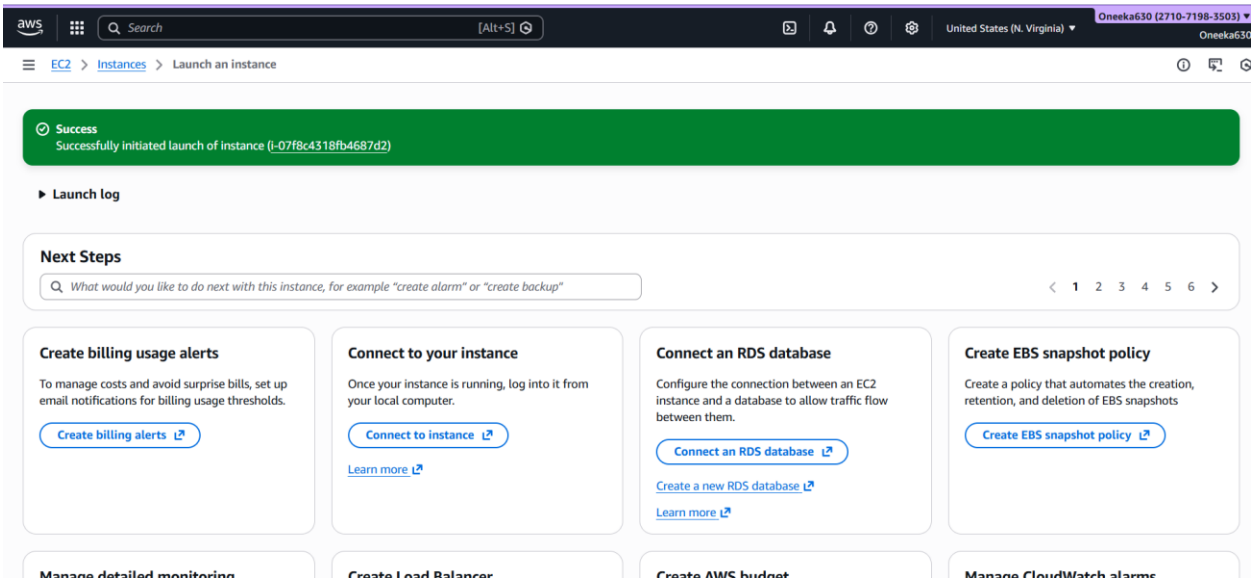
STEP 9. In '**Key pair (login)**', click on '**Create new key pair**', give '**key pair name**' and create it. -> For '**Network Settings**' from '**Select existing security group**' choose the security group you just created



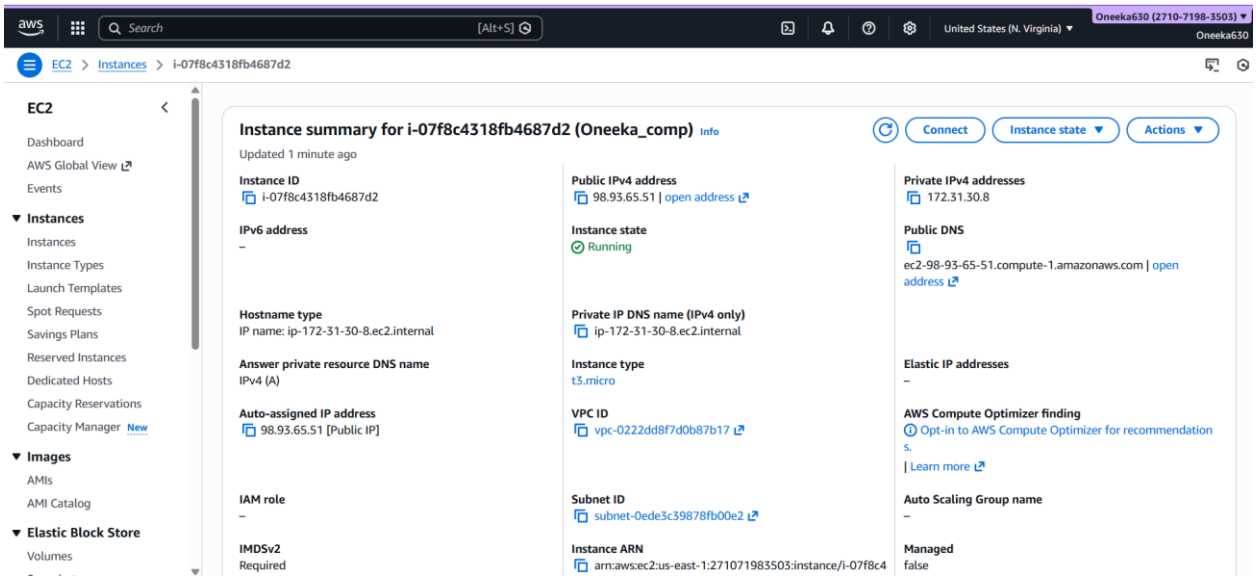
STEP 10. Scroll Down and Click on '**Advanced details**' -> In 'Advanced details' go to the last, in advanced data put the following bash script. Then click on '**Launch instance**'.



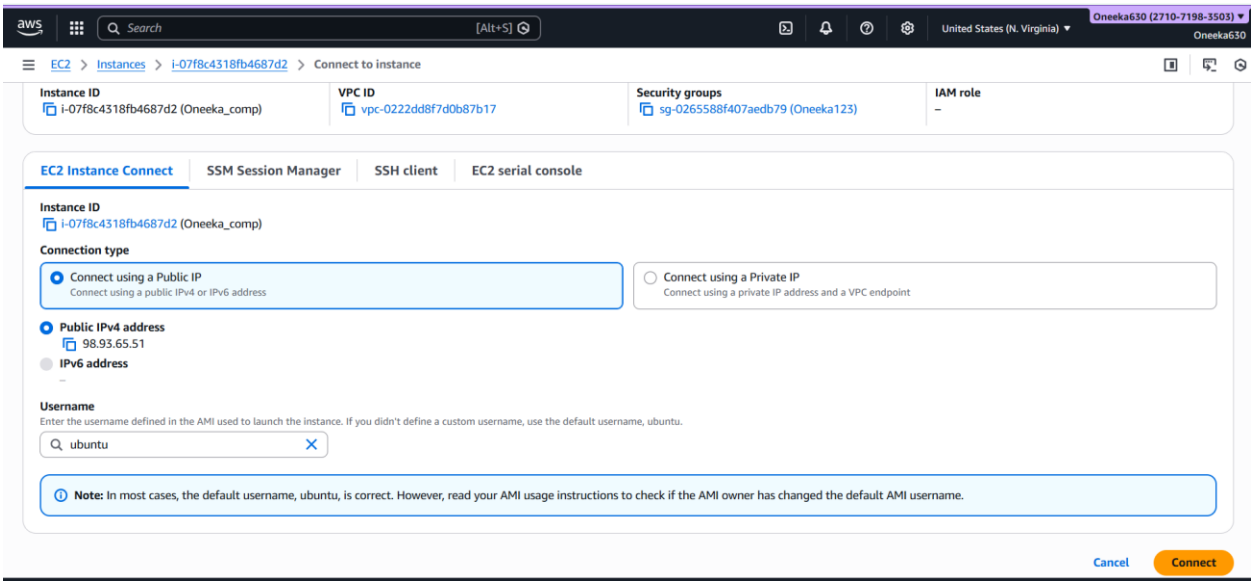
STEP 11. ‘**Oneeka_comp’** instance is created successfully.



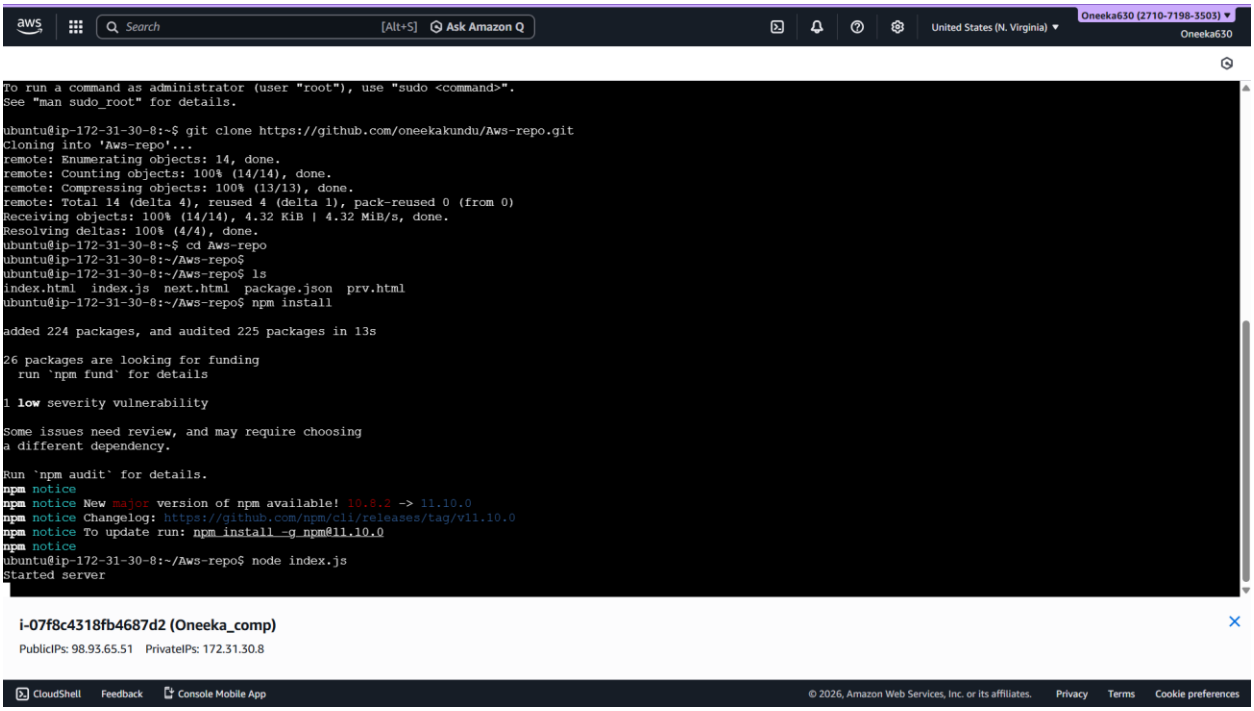
STEP 12. Now click on the **instance ID**.



STEP 13: Click on **connect** to instance.



STEP 14: Clone your GitHub repository and install npm.



STEP 15: Now copy the **IPv4 address** of the instance and add a **:4000** to it .
